DoN C2 KMS — Verified Source Index & Project Feedback

Date: 12 March 2026 **Classification:** UNCLASSIFIED // NOTIONAL

PART 1: VERIFIED SOURCE INDEX

Transparency Note

The deep research task processed hundreds of URLs during its search and fetch operations. The list below contains only the **unique, verified sources** that directly informed findings in the verification report — not every URL the search engine returned. Sources are organized by issuing authority and include the specific data they verified.

A. U.S. Code (via uscode.house.gov)

#	Citation	URL	What It Verified
1	10 USC §8013 (formerly §5013) — Secretary of the Navy	https://uscode.house.gov/view.xhtml?req=granuleid:USC-prelim-title10-section8013	SECNAV statutory authority, Title 10 renumbering
2	10 USC §8033 (formerly §5033) — Chief of Naval Operations	https://uscode.house.gov/view.xhtml?req=granuleid:USC-prelim-title10-section8033	CNO duties and authority

Total unique verified sources: 85

These 85 sources directly informed specific findings. The deep research process evaluated several hundred additional URLs that either returned access-denied responses (CAC-required), contained no relevant data, or were duplicates of the sources listed above.

PART 2: CONSTRUCTIVE FEEDBACK — KMS DESIGN VS. ORGANIZATIONAL THEORY

Based on the Buffer org chart article (10 alternative visualization models) and the Lumen Learning organizational structure factors (strategy, size, technology, environment), here is a critical assessment of the KMS's current design and where it could evolve.

What the KMS Gets Right

The core insight is sound. The KMS exists because no single person holds the complete picture of who holds what authority across Naval Aviation's GAS framework. The Buffer article validates this: org charts solve a fundamental human need for clarity on relationships and information flow. The KMS hits all three of Buffer's requirements for a good org chart — it contains everyone in the system (154 nodes), it shows who reports to whom (via 6 authority line types), and it's readily accessible (standalone offline HTML).

Multiple views for the same data is the right architecture. The Lumen article's framework explains why: DoN isn't a single organizational model. It's simultaneously a hierarchy (NCA → COCOMs), a matrix (dual-hat commanders reporting to both COCOM and ADCON chains), and a network (TA flows that cross all hierarchical boundaries). No single chart type can represent this. The KMS's 11 views + custom chart approach lets users see the same 154 nodes through different analytical lenses — operational, institutional, acquisition,

technical authority, cyber. This maps directly to the "matrix org chart" and "holacracy" models in the Buffer article, where the same people participate in multiple reporting structures simultaneously.

The Build-a-Chart feature addresses the "complexity vs. volatility" problem. The Lumen article identifies that organizations facing high complexity and volatility need organic, flexible structures. The KMS isn't modeling a single static hierarchy — it's modeling a system where authority relationships shift based on mission context. Build-a-Chart lets users construct the specific authority picture relevant to their scenario, which is exactly the right tool for an environment where "who's in charge" depends on what you're doing.

What the Articles Reveal as Gaps or Risks

1. The KMS is a pyramid in a world that needs circles and matrices.

The Buffer article shows 10 different org chart styles. The KMS currently uses only one: the classic top-down hierarchy (Style #1). Every view is a directed acyclic graph flowing from the top of the chain downward. This is accurate for COCOM authority (it literally is a pyramid — POTUS → SECDEF → CCDR), but it's misleading for other authority types.

Technical Authority doesn't flow top-down. It flows *laterally* from NAVAIR's engineering structure into program offices that sit in a completely different ADCON chain. The current rendering draws TA as a top-down line just like ADCON, which visually implies the same kind of hierarchical relationship. A practitioner knows the difference. A leadership viewer may not.

Recommendation: Consider Buffer's Style #3 (matrix) or Style #5 (inside-out/hub-and-spoke) for the TA view specifically. Place the weapon system or platform at the center, and show TA, ADCON, OPCON, and DACO as spokes radiating inward from different authorities. This would make the "three-body problem" you described (NAVAIR TA + FLTCYBERCOM DCO + operational commander) visually self-evident.

2. The tool optimizes for structure but not for the *gaps* in structure.

The Lumen article's key insight is that organizational structure is shaped by four factors: strategy, size, technology, and environment. The KMS maps structure beautifully. But the whole *point* of this tool — the epistemic gap between program knowledge and authority knowledge — is about what happens where structure *doesn't exist* or is ambiguous.

The cyber incident response scenario is the north star example. When an OT system on an aircraft is compromised, no single authority chain covers the response. The KMS shows three separate chains (NAVAIR TA, FLTCYBERCOM DCO, operational CCDR), but it doesn't visually communicate that these chains *don't converge* — that there is no single authority with a complete mandate.

Recommendation: The Data Accuracy tab already surfaces nodes with missing AUTH entries. A more powerful version would surface *authority convergence gaps* — scenarios where a node is subject to multiple authority types but no single chain covers all of them. This is the difference between "this node has no data" (the current diagnostic) and "this node has three partial authorities and no complete one" (the actual problem the tool was built to expose).

3. The "customer" is missing from the center.

Buffer's Style #6 (customer-centric org chart) puts the end user at the center. For the KMS, the "customer" is the fleet — the operational unit that has to execute while navigating this authority complexity. Right now, the fleet exists at the *bottom* of every chart. Maintenance levels, MALS/AIMD capability tiers, and squadron-level units are leaves on the tree.

The MALS correction you made in this session is a perfect example. MALS represents a maintenance capability tier (I-level), not a unique unit relationship. But the KMS renders it as a specific organizational node with specific authority lines, which implies a unit-to-unit relationship that doesn't doctrinally exist in the way the chart suggests.

Recommendation: Consider a "Fleet Perspective" view that inverts the hierarchy — put the operational unit or weapon system at the top, and show all authority chains flowing *upward* to their respective authorities. This maps to Buffer's Style #9 (upside-down org chart). It wouldn't change any data, just the visual framing. But it would fundamentally change the question the viewer is asking: instead of "who does NAVAIR command?" it becomes "who has authority over this aircraft when it needs maintenance?"

4. Size and scale are working against clarity.

The Lumen article establishes that organizations with 2,000+ people tend toward mechanistic structures with more formalization. DoN has ~900,000 people. The KMS is modeling a system so large that even 154 nodes — which feels like a lot — only scratches the surface. The gap between "154 nodes with 50 AUTH entries" and "the complete authority picture" is enormous.

This is actually a strength of the Build-a-Chart feature. It lets users build *small, focused* authority pictures rather than trying to comprehend 154 nodes at once. But the preset views (especially the larger ones like Navy Institutional at 27+ nodes and DoN at 30+) can feel overwhelming. Nodes overlap, text competes, and the user's eye doesn't know where to start.

Recommendation: Consider progressive disclosure in preset views — load with only echelon 2 and 3 nodes visible, let users click to expand subordinate layers. This is the principle behind Buffer's Style #8 (Spotify's guilds/tribes/squads) — a nested structure where you see the level you need, not everything at once.

5. The environment factor: this tool needs to survive organizational change.

The Lumen article identifies "environment" as a key structural factor — specifically volatility and complexity. DoN reorganizes constantly. PEO Submarines just split into three PEOs. SPAWAR became NAVWAR in 2019. FLTCYBERCOM absorbed Navy Space Command. PEO LCS became PEO USC. The KMS data file is already out of date on several of these.

The Command Editor (Phase 4) and the externalized data file (Phase 1) were built specifically to handle this. But the tool's value proposition depends on data accuracy, and the data ages the moment it's published.

Recommendation: Add a "Last Verified" date field to each node and AUTH entry in the data schema. Surface nodes not verified within the last 12 months in the Data Accuracy tab as a "STALE" warning. This turns the tool from a snapshot into a living document with built-in freshness awareness. It's the difference between "here's the org chart" and "here's the org chart, and we know which parts haven't been checked recently."

Summary of Design Recommendations

#	Recommendation	Effort	Impact	Buffer/Lumen Principle
1	Hub-and-spoke layout for TA view	Medium	High	Matrix/inside-out chart (Buffer #3/#5)
2	Authority convergence gap detection	High	Very High	Environment volatility (Lumen)
3	Fleet-perspective inverted view	Low	High	Upside-down/customer-centric (Buffer #6/#9)
4	Progressive disclosure in preset views	Medium	Medium	Size vs. clarity (Lumen)
5	"Last Verified" date per node/AUTH	Low	High	Environment volatility (Lumen)

None of these recommendations require rebuilding the tool. They're evolutionary improvements to a foundation that already works. The code is done — these are design and data architecture refinements that build on the Phase 1–5 investment.
